

Business Analysis Report

QuickEats — SaaS Food Delivery Platform

Tool: Power BI | Analysis Period: 2020 – 2024 | Dashboards: Revenue & Operations | Subscription & SaaS Metrics

1. Business Objective

QuickEats required a performance tracking system for its food delivery SaaS platform to provide full visibility into revenue performance, subscription health, customer behaviour, and delivery operations across the 2020–2024 period. Two Power BI dashboards were built to answer strategic business questions about growth, retention, and profitability.

This enabled the business to:

- Monitor total revenue, gross bookings, and net profit margin across five years of operations
- Track subscription health through MRR trends, churn rates, and active restaurant counts by plan tier
- Understand how revenue is distributed across payment methods, customer segments, and geographies
- Identify operational risks such as high cancellation rates and delivery completion gaps

2. Scope of the Report

In Scope

- Revenue and operations metrics: gross revenue, gross bookings, refunds, discounts, delivery rates, and order statuses
- Subscription metrics: MRR, plan tier distribution, active restaurant counts, and churn rates by tier
- Customer segmentation analysis: High, Medium, and Low Value customer revenue contribution
- Payment method and payment gateway performance analysis
- Geographic revenue distribution by customer city
- Time-series analysis: monthly revenue trends and MoM growth rates (2020–2024)

Out of Scope

- Individual order-level operational details not surfaced in the dashboards
- Marketing campaign spend or paid acquisition channel analysis
- Post-2024 projected or forecast data

3. KPIs & Definitions

The following KPIs were implemented across both dashboards and are referenced throughout this report:

KPI	Definition	Formula	Dashboard
Total Revenue	Combined subscription + delivery revenue	Subscription Revenue + Gross Revenue	Revenue & Ops

KPI	Definition	Formula	Dashboard
Gross Booking	Total value of all orders placed (pre-deductions)	SUM(order gross value) 2020–2024	Revenue & Ops
Gross Revenue	Revenue generated from order commissions	Gross Bookings – Refunds – Discounts	Revenue & Ops
Subscription Revenue	Total SaaS plan fees collected from restaurants	SUM(billing.base_fee) all active periods	Both
Net Revenue	Profit after all costs and deductions	Gross Revenue – Operating Costs	Revenue & Ops
Refund Rate	% of gross revenue returned as refunds	(Refunds ÷ Gross Revenue) × 100	Revenue & Ops
Delivery Rate	% of orders successfully delivered	(Delivered Orders ÷ Total Orders) × 100	Revenue & Ops
Cancellation Rate	% of orders cancelled before delivery	(Cancelled Orders ÷ Total Orders) × 100	Revenue & Ops
MRR	Monthly Recurring Revenue from subscriptions	SUM(active restaurant fees) per month	SaaS Metrics
Churn Rate	% of restaurants cancelling subscription per period	(Restaurants Lost ÷ Start Count) × 100	SaaS Metrics
AOV	Average value per delivered order	Gross Revenue ÷ Total Delivered Orders	Revenue & Ops
Discount Rate	% of gross revenue given as discounts	(Discounts ÷ Gross Revenue) × 100	Revenue & Ops

4. Platform-Level KPI Results

The Revenue & Operations dashboard surfaces 10 headline KPI cards representing the full performance picture for the 2020–2024 period. The table below shows every KPI card value as displayed in the dashboard alongside its business interpretation:

KPI	Value	Sub-note	Business Interpretation
Total Revenue	\$15.02M	Subscription + delivery combined	The platform's complete revenue envelope over five years, combining both SaaS and transactional income streams
Gross Booking	\$13.41M	5-year total (2020–2024)	Total order value placed through the platform before any deductions — represents full customer spend volume
Gross Revenue	\$8.67M	Revenue generated by orders	Actual revenue retained after refunds and discounts — the operational income from all 100K orders
Subscription Revenue	\$6.35M	Total subscription income	SaaS revenue from restaurant plan fees — nearly 42% of total revenue, demonstrating the platform's recurring income stability
Net Revenue	\$1.70M	21% as profit	The platform retains only \$0.21 of every \$1.00 of gross revenue — margin improvement is a key strategic priority

KPI	Value	Sub-note	Business Interpretation
Refunds	\$54.55K	0.7% refund rate	Refund rate is healthy and well below the 2% industry benchmark — indicates strong order fulfilment quality
Discount Given	\$1.00M	11.5% of gross revenue	Discount spend is significant at 11.5% — analysis required to confirm whether discounts generate incremental orders or simply subsidise existing spend
Delivery Rate	64.90%	Cancel rate: 7.02%	Nearly 35% of orders do not result in a delivery — this is the single largest operational gap on the platform
Unique Customers	19.87K	Of 50,000 registered users	Only 39.7% of registered users have ever placed an order — significant unconverted user base represents a growth opportunity
Total Orders	100K	Avg \$135.22 / order	Average order value of \$135.22 is high, suggesting the platform serves professional or multi-item commercial orders rather than casual consumer meals

5. Dashboard Charts & What They Answered

Each chart in both dashboards was built to answer a specific business question. The following section documents every visual, its business question, the data it showed, and the insight it produced.

Chart 1: Gross Revenue & Gross Booking by Order Month

Visual Type: Dual-axis line chart — Gross Revenue on left Y-axis (120K–160K), Gross Booking on right Y-axis (200K–250K), Order Month on X-axis (2020–2024)

Business Question: What is causing the monthly gross revenue fluctuations, and are there specific months that consistently outperform or underperform across all five years?

What the dashboard showed:

Period	Gross Revenue Range	Gross Booking Range	Pattern Observed
2020	~\$120K–\$140K monthly	~\$200K–\$220K monthly	Platform early stage — lower but stable volume with gradual upward trend
2021	~\$130K–\$155K monthly	~\$210K–\$235K monthly	First visible acceleration — multiple months exceed \$145K gross revenue
2022	~\$120K–\$160K monthly	~\$200K–\$250K monthly	Highest volatility year — sharpest peaks and troughs across the five-year period
2023	~\$125K–\$150K monthly	~\$205K–\$240K monthly	Stabilisation phase — volatility reduces, revenue trends in a tighter band
2024	~\$135K–\$160K monthly	~\$215K–\$250K monthly	Recovery and growth — gross booking approaches \$250K in peak months

The MoM % chart confirms this pattern — growth swings between –10% and +17% with no sustained multi-month positive run. Peaks appear approximately every 2–3 months, consistent with recurring promotional cycles rather than organic

seasonal demand. The gap between gross booking and gross revenue remains stable at approximately \$65K–\$90K per month, indicating that discounts and refunds as a proportion of order value are consistent over time.

Insight: Gross revenue fluctuations are driven by irregular promotional cycles rather than true seasonality. The consistent ~\$70K monthly gap between gross booking and gross revenue confirms that discount and commission structures are stable. To smooth revenue volatility, the platform should formalise a predictable bi-monthly promotional calendar to convert the existing erratic peaks into a structured, repeatable growth pattern.

Chart 2: Gross Revenue by Payment Method

Visual Type: Donut chart showing gross revenue share by payment method across all orders

Business Question: Does payment method have any relationship with how much customers spend per order?

What the dashboard showed:

Payment Method	Gross Revenue	Revenue Share	Implication
Credit Card	\$2.60M	28.27%	Highest revenue share — Credit Card users are the platform's primary high-value payment segment
Debit Card	\$2.24M	24.09%	Second largest — combined with Credit Card, card payments represent 52.36% of all gross revenue
PayPal	\$1.22M	14.90%	Strong third — PayPal users represent a digitally active segment likely placing repeat orders
Apple Pay	\$1.00M	~12%	Significant mobile payment share — indicates a substantial mobile app user base
Google Pay	\$0.62M	7.62%	Smaller share — growing but not yet reaching Apple Pay volumes
Cash	\$0.17M	3.18%	Minimal share — cash orders are declining, likely concentrated in dine-in or specific restaurant types
Crypto	< \$0.1M	< 2%	Negligible — likely a test feature or very early adopter segment
Gift Card	< \$0.1M	< 2%	Minimal — suggests gift card programme has not gained traction

The data shows that card-based payments (Credit + Debit) generate 52.36% of gross revenue from what is likely a similar proportion of orders. However, given the platform's high AOV of \$135.22, it is most probable that Credit Card users place higher-value commercial or bulk orders. The concentration of revenue in two payment methods also represents a risk — any gateway disruption to Visa/Mastercard networks would materially impact over half of gross revenue.

Insight: Credit Card users are the platform's most valuable payment segment by revenue. The platform should prioritise Credit Card checkout optimisation, offer cashback or loyalty points for card transactions, and investigate whether Credit Card orders carry a meaningfully higher AOV than digital wallet orders. The low Cash and Gift Card shares suggest the platform has successfully shifted toward digital-first payments.

Chart 3: Gross Revenue by Customer Value Segment

Visual Type: Bar chart — three segments on X-axis (High Value, Medium Value, Low Value Customers), Gross Revenue USD on Y-axis

Business Question: How concentrated is the platform's revenue across the three customer value segments, and what does that mean for the business?

What the dashboard showed:

Segment	Gross Revenue	Approx. Share	Interpretation
High Value Customers	~\$6.0M	~69%	A small group of high-frequency, high-spend customers drives the vast majority of gross revenue
Medium Value Customers	~\$1.5M	~17%	Mid-tier customers contribute meaningfully but are not the core revenue engine
Low Value Customers	~\$0.5M	~6%	Low Value customers generate minimal revenue despite potentially representing a large share of order count
Unattributed / Other	~\$0.67M	~8%	Orders not yet assigned to a value segment — likely new customers or one-time purchasers

The revenue distribution is highly concentrated. Approximately 69% of gross revenue is generated by the High Value segment. This is consistent with a Pareto-type distribution — a small proportion of customers (likely under 20% of the 19,870 unique customers) generate the vast majority of revenue. The platform's survival is therefore disproportionately dependent on retaining its High Value customers.

This concentration also reveals a significant growth lever: Medium Value customers generating \$1.5M have demonstrated commercial intent. A targeted upgrade programme — loyalty incentives, volume discounts, or dedicated account management — could accelerate their migration into the High Value tier.

***Insight:** Revenue is critically concentrated in the High Value segment. Losing even a small number of High Value customers would materially reduce gross revenue. The platform must implement dedicated retention programmes for this segment (priority support, loyalty rewards, personalised promotions) while simultaneously building a pipeline to elevate Medium Value customers. The Low Value segment should be analysed for engagement potential rather than treated as a write-off.*

Chart 4: MRR by Quarter & Active Restaurants by Quarter and Plan Tier

Visual Type: Line chart (MRR by Quarter) + Multi-line chart (Active Restaurants by Quarter, coloured by Plan Tier: Enterprise, Growth, Pro, Starter)

Business Question: What is driving the MRR decline from Q2 2021 through Q2 2025, and is it linked to the drop in active restaurant counts?

What the dashboard showed:

Quarter	MRR (approx.)	Total Active Restaurants	Key Observation
Q2 2021 (Peak)	~\$0.45M	~900 across all tiers	Platform at its highest subscription volume — all four plan tiers at maximum active count
Q4 2022	~\$0.30M	~600 across all tiers	Clear downward trajectory begins — active count and MRR both declining in parallel

Quarter	MRR (approx.)	Total Active Restaurants	Key Observation
Q2 2023	~\$0.22M	~450 across all tiers	Decline accelerates — MRR has lost more than 50% of its Q2 2021 peak
Q4 2024	~\$0.08M	~150 across all tiers	Severe deterioration — most plan tiers approaching near-zero active restaurants
Q2 2025	~\$0.02M	< 50 across all tiers	Near-total collapse of MRR — platform subscription revenue approaching zero

The parallel decline of both MRR and active restaurant counts confirms that the MRR drop is directly caused by restaurant churn — not plan downgrades or pricing changes. All four plan tiers show the same downward trajectory, ruling out a tier-specific issue and pointing instead to a platform-wide retention failure. The Growth plan (which has the highest absolute subscriber count at 2.29K) shows the steepest absolute decline, while Enterprise, despite its high revenue per restaurant, has also lost the majority of its active base.

The decline beginning in Q3–Q4 2021 suggests an external or competitive trigger — possibly the post-pandemic normalisation of in-person dining reducing digital ordering demand, or the emergence of competitor platforms capturing market share.

***Insight:** MRR decline is entirely driven by restaurant churn across all plan tiers simultaneously. This is not a pricing or feature problem — it is a retention and competitive positioning problem. The platform needs an urgent churn reduction programme targeting all tiers, with immediate intervention for Growth (highest absolute losses) and Enterprise (highest revenue losses). A net revenue retention (NRR) target below 100% must be addressed before any new acquisition spend is justified.*

Chart 5: Churn Rate % by Plan Tier

Visual Type: Bar chart — Plan Tier on X-axis (Enterprise, Growth, Pro, Starter), Churn Rate % on Y-axis (0%–15%)

Business Question: Why does Enterprise have the highest churn rate, and why would the highest-paying restaurants be leaving at a higher rate than lower-tier subscribers?

What the dashboard showed:

Plan Tier	Churn Rate	Monthly Fee	Subscribers	Revenue Impact per Churn
Enterprise	~13.5%	\$999/mo	1.36K total	Each Enterprise churn costs \$999/month — the highest revenue impact of any single churn event
Growth	~12.0%	\$149/mo	2.29K total	High volume churn — most restaurants on Growth, so absolute churn numbers are the largest
Pro	~11.5%	\$349/mo	2.51K total	Similar to Growth rate — Pro restaurants churning at nearly the same frequency
Starter	~11.0%	\$49/mo	2.36K total	Lowest churn rate — Starter restaurants may have lower expectations and lower switching costs

The counterintuitive finding is that Enterprise customers — who pay the most and theoretically have the deepest platform integration — churn at the highest rate. Several explanations are supported by the data pattern:

- Enterprise restaurants have higher expectations for platform performance, support quality, and feature delivery. If those expectations are not met, they are also more likely to have the resources and motivation to switch to a competitor.
- Enterprise restaurants likely conducted a formal procurement evaluation before signing. If the platform fails to deliver on committed SLA or feature roadmap items, Enterprise clients will initiate the same procurement process to find a replacement.
- At \$999/month, Enterprise clients have a financial incentive to negotiate or leave if ROI is not clearly demonstrated. Without a dedicated customer success function, these clients may not receive proactive value reinforcement.
- The Starter tier's lower churn rate is likely explained by lower expectations, lower switching motivation (small restaurants with limited resources), and the low cost making it easier to keep paying even without heavy usage.

Insight: Enterprise churn at 13.5% is the most financially damaging churn rate on the platform. Each lost Enterprise restaurant costs \$11,988 annually. The platform must immediately assign dedicated Customer Success Managers to all Enterprise accounts, implement quarterly business reviews, and build an Enterprise health score that flags at-risk accounts before they initiate cancellation. The goal should be to bring Enterprise churn below 8% within 12 months.

Chart 6: Total Subscriptions & Subscription Revenue by Plan Tier

Visual Type: Bar chart (total subscriptions by plan tier) + Donut chart (subscription revenue share by plan tier)

Business Question: Does having more subscribers always mean more revenue, and how do the four plan tiers compare in revenue efficiency per subscriber?

What the dashboard showed:

Plan Tier	Subscribers	Revenue	Revenue Share	Revenue per Subscriber	Efficiency Rank
Pro	2.51K (highest)	\$2.06M	32.41%	~\$820 per subscriber	1st
Enterprise	1.36K (lowest)	\$1.84M	29.07%	~\$1,353 per subscriber	2nd — highest unit value
Starter	2.36K	\$0.86M	13.52%	~\$364 per subscriber	4th — lowest unit value
Growth	2.29K	\$1.29M	20.40%	~\$563 per subscriber	3rd

The data directly answers the question: having more subscribers does not mean more revenue. Pro has the most subscribers (2.51K) and generates the highest total revenue (\$2.06M). However, Enterprise, with 46% fewer subscribers than Pro, generates \$1.84M — nearly the same total revenue — because each Enterprise subscriber is worth 65% more (\$1,353 vs. \$820).

Starter is the critical finding: despite having 2.36K subscribers (the second highest count), it generates only \$0.86M — the lowest revenue share at 13.52%. Starter restaurants generate less than one-quarter of the revenue per subscriber that Enterprise restaurants generate. The platform is carrying a large base of low-yield subscribers whose revenue contribution does not justify the support and infrastructure cost.

Insight: Revenue efficiency per subscriber reveals that Enterprise is the most valuable plan tier by unit economics, followed by Pro. The Starter tier is significantly under-monetised — 2.36K Starter subscribers generate the same total revenue as 636 Enterprise subscribers would. The strategic priority should be to migrate Starter subscribers

upward through targeted upsell campaigns, while protecting and expanding the Enterprise base where each retention has 3.7x the revenue value of retaining a Starter subscriber.

6. Business Questions Answered — Summary

The table below maps each of the six original business questions to the dashboard element that answered it and the key finding discovered:

#	Business Question	Dashboard Element	Key Finding
Q1	What is causing monthly gross revenue fluctuations?	Gross Revenue & Gross Booking by Month + MoM % Chart	Fluctuations are driven by irregular promotional cycles, not seasonality. The ~\$70K monthly gap between gross booking and gross revenue is structurally stable.
Q2	Does payment method relate to how much customers spend?	Gross Revenue by Payment Method (donut chart)	Credit Card (28.27%) and Debit Card (24.09%) dominate revenue. Card users likely have the highest AOV. Over 52% of revenue flows through just two payment types.
Q3	How concentrated is revenue across customer value segments?	Gross Revenue by Customer Value Segment (bar chart)	High Value customers generate ~69% of gross revenue. Revenue is critically concentrated — losing a small number of high-value customers would be materially damaging.
Q4	What is driving the MRR decline from Q2 2021 to Q2 2025?	MRR by Quarter + Active Restaurants by Quarter & Plan Tier	MRR collapse is entirely caused by restaurant churn across all plan tiers simultaneously — not pricing changes. Platform lost ~85% of its peak MRR within four years.
Q5	Why does Enterprise have the highest churn rate?	Churn Rate % by Plan Tier (bar chart)	Enterprise restaurants have higher expectations and higher switching capability. Without a dedicated Customer Success function, high-value clients are at risk of leaving unnoticed.
Q6	Does more subscribers always mean more revenue?	Subscriptions by Plan Tier (bar) + Revenue by Plan Tier (donut)	No. Enterprise generates \$1,353 per subscriber vs. \$364 for Starter. Starter's 2.36K subscribers produce the least revenue despite being the second largest subscriber group.

7. Strategic Recommendations

Based on the findings from all six dashboard questions, the following four actions are recommended as immediate priorities:

Priority 1 — Stop the MRR Bleed

With MRR declining from \$0.45M to near \$0M over four years, churn reduction is the most urgent business priority. Implement a restaurant health score across all plan tiers that flags accounts showing reduced order volume, declining login activity, or approaching contract renewal. Assign proactive outreach to any account with a health score below threshold.

Priority 2 — Protect High Value Customers

With ~69% of gross revenue concentrated in the High Value customer segment, losing even 10–15% of these customers would reduce gross revenue by approximately \$600K–\$900K. A dedicated retention programme — priority support queues, personalised promotions, loyalty tier upgrades — must be operational before any growth investment is made.

Priority 3 — Improve Delivery Completion Rate

The 64.9% delivery completion rate means that 35% of orders do not result in a completed delivery. At an AOV of \$135.22 and 100K total orders, improving the completion rate by 5 percentage points would result in approximately 5,000 additional completed deliveries and ~\$676K in additional gross revenue annually — with no acquisition cost.

Priority 4 — Upsell Starter Subscribers

Starter subscribers generate only \$364 per subscriber versus \$1,353 for Enterprise. A structured upsell pathway — triggered at specific usage thresholds such as order volume, menu item count, or time on platform — could migrate even 15% of the 2.36K Starter base into Growth tier, generating an additional ~\$235K in annual subscription revenue.
