

QuickEats — SaaS Food Delivery Platform

Business Context • Analysis Questions • Dataset Overview

1. Company Definition

QuickEats is a B2B2C SaaS platform that provides white-label ordering and delivery technology to restaurants, cloud kitchens, and food businesses. Restaurants subscribe to one of four plan tiers — Starter, Growth, Pro, or Enterprise — and use the platform to receive digital orders, manage menus, dispatch drivers, and process customer payments.

The platform earns revenue from two streams: monthly subscription fees paid by restaurants, and per-order commissions. Over the 2020–2024 period, QuickEats processed 100,000 orders across 19,870 unique customers and generated \$15.02M in total revenue, with a net profit margin of 21%.

2. Revenue & Operations — Questions

#	Question
Q1	Gross revenue fluctuates significantly from month to month between 2020 and 2024 — what is causing those fluctuations, and are there specific months that consistently outperform or underperform across all five years?
Q2	Credit Card and Debit Card together account for over 52% of gross revenue — does payment method have any relationship with how much customers spend per order?
Q3	High Value customers appear to generate far more revenue than Medium and Low Value segments combined — how concentrated is the platform's revenue across these three customer segments, and what does that mean for the business?

3. Subscription & SaaS Metrics — Questions

#	Question
Q4	MRR shows a consistent downward trend from Q2 2021 through Q2 2025 — what is driving this decline, and is it linked to the simultaneous drop in active restaurant counts across all plan tiers?
Q5	Enterprise has the highest churn rate among all plan tiers — why would the highest-paying restaurants be leaving the platform at a higher rate than lower-tier subscribers?
Q6	Pro plan has both the highest number of subscriptions and the highest revenue share — does having more subscribers always mean more revenue, and how do the other three plan tiers compare in terms of revenue per subscriber?

4. Dataset Tables Overview

Table	What It Contains
users.csv	All 50,000 registered platform users. Contains personal details, registration date, loyalty tier, referral information, and total lifetime spend.

Table	What It Contains
restaurants.csv	All 5,000 restaurants subscribed to the platform. Includes plan tier, commission rate, city, average rating, operating hours, and delivery radius.
drivers.csv	All 8,000 delivery drivers. Tracks vehicle type, on-time rate, average rating, total deliveries completed, earnings, and assigned zone.
customers.csv	20,000 customer profiles of users who placed at least one order. Includes total spend, loyalty tier, churn risk label, and preferred payment method.
orders.csv	100,000 orders placed between 2020 and 2024. The main fact table — contains order status, channel, subtotal, delivery fee, discount, tip, and promo code used.
payments.csv	One payment record per order. Covers payment method, gateway used, transaction status, fraud score, and any refund details.
delivery.csv	80,000 delivery execution records. Contains pickup and dropoff times, distance, weather, traffic level, and whether the delivery was on time.
reviews.csv	60,000 customer reviews after order completion. Includes ratings for food, delivery, driver, packaging, and value, plus sentiment label.
promotions.csv	10,000 promotional campaigns and discount codes. Covers promo type, discount amount, usage count, target customer segment, and active status.
billing.csv	15,000 subscription invoices sent to restaurants. Records plan tier, base fee, overage charges, total billed, and payment status.
